Prompt:
Explain why the predicted lane line is a structure_error.

ChatGPT 5.2 Output:

The predicted lane line lies along a visible light-colored road marking/edge feature in the highlighted region rather than being placed on plain unmarked asphalt.

[Check Existence]

That marking appears as a continuous boundary-like feature, which is consistent with a virtual boundary line rather than a dashed or double-line pattern.

[Check Catogory]

However, the predicted line drifts off the center of the visible boundary and becomes wavy, and it also starts and ends partway along the visible feature instead of covering it continuously through the region.

[Check Geometry]
